Homework 2 Orbital Dynamics - Interplanetary flight

Student 1: Mario Barrantes Mellado 100471762

Student 2: Artem Lorenzo Lymar 100471784

The date is January 1, 2312. A spaceship is planning a trip from Venus (B) low orbit to Mercury (A) low orbit, with the data below:

```
close all; clear all; clc;

% Parameters of orbit around Venus
a_V = 10000; %
e_V = 0; % circular orbit
Omega_V = deg2rad(30); % [deg]->[rad]
i_V = deg2rad(15); % [deg]->[rad]

% Parameters of orbit around Mercury
a_M = 10000; %
e_M = 0; % circular orbit
Omega_M = deg2rad(50); % [deg]->[rad]
i_M = deg2rad(-40); % [deg]->[rad]

% Gravitational Parameters
mu_V = 3.24859e5;  % [km^3/s^2] - not needed for heliocentric problem
mu_M = 0.220318e5; % [km^3/s^2] - not needed for heliocentric problem
mu_S = 1327120e5;  % [km^3/s^2]
```

a) Implement the following functions

i) Dt = tof(mu,a,e,theta1,theta2)

```
% theta1 = deg2rad(10); % [deg]->[rad]
% theta2 = deg2rad(30); % [deg]->[rad]
%
% Dt = functionshw2.tof(mu_V, a_V, e_V, theta1, theta2); % Time of travel between
theta1 and theta2 [s]
% fprintf('\nTime of flight = %.4f s = %.4f days\n', Dt, Dt/86400);
```

ii) [a,e,Omega,i,omega,theta1,theta2] = Lambert conic(r1,r2,eT,k)

Function to compute the COE of the transfer trajectory (with a in km and angles in rad) between position vectors r1 and r2 (in km), as a function of the transverse eccentricity component, eT. Vector k defines the positive direction of the orbital plane normal and therefore selects between short and long arc solutions.

```
% r1 = [8945.34;5000;3000]; %km
% r2 = [7214.83899;2000;8249.64731]; %km
% eT = 0.4; %
% k = cross(r1,r2)/norm(cross(r1,r2)); % Normal vector to orbit plane
%
```

```
% [a, e, Omega, i, omega, theta1, theta2] = functionshw2.Lambert_conic(r1, r2, eT,
k);
```

iii) [a,e,Omega,i,omega,theta1,theta2] = Lambert solve(mu,r1,r2,Dt,k)

Solve Lambert's problem using the previous two functions. Internally, the function should use the bisection method. Restrict the search to elliptic solutions. The units of input and output arguments just be the same as in previous functions.

```
% Dt = functionshw2.tof(mu_V, a, e, theta1, theta2);
% fprintf('\nTarget time of flight = %.4f s\n', Dt);
%
% [a_s, e_s, Omega_s, i_s, omega_s, theta1_s, theta2_s, eT_lambert] =
functionshw2.Lambert_solve(mu_V, r1, r2, Dt, k);
%
% fprintf('Lambert_solve results:\n');
% fprintf('a = %.4f km\n', a_s);
% fprintf('eTlambert = %.4f\n', eT_lambert);
% fprintf('e = %.6f\n', e_s);
% fprintf('Omega = %.4f deg\n', rad2deg(Omega_s));
% fprintf('i = %.4f deg\n', rad2deg(i_s));
% fprintf('omega = %.4f deg\n', rad2deg(omega_s));
% fprintf('theta1= %.4f deg\n', rad2deg(theta1_s));
% fprintf('theta2= %.4f deg\n', rad2deg(theta2_s));
%
% % tof matches input Dt?
% Dt_check = functionshw2.tof(mu_V, a_s, e_s, theta1_s, theta2_s);
% fprintf('Verification: tof(solution) = %.4f s  (target = %.4f s)\n', ...
%     Dt_check, Dt);
% fprintf('Error = %.6f s\n', abs(Dt_check - Dt));
```

To verify Lambert_solve is correct we build a test case using `r1`, `r2` and `Dt` derived from a known orbit with `eT = 0.4` (from question a.ii). The solver correctly recovers the same orbital elements and time of flight, therefore this function is OK.

b) [theta, Dv] = hyperbola(mu, a, e, Omega, i, omega, $\mathbf{v}_h$)

To find the parking orbit true anomaly, θ (rad), and the injection impulse vector, $\Delta\mathrm{v}$ (km/s.), to go from parking orbit to escape hyperbola.

```
% r_park = 5000; % radius of parking orbit [km] = pericenter of hyperbolic scape
trajectory
% e_park = 1; % parking orbit is circular
% a_park = r_park; % parking orbit is circular
% mu_park = mu_V; % change depending on central body
% vh_park = sqrt(-mu_park/a_park); % hyperbolic excess velocity [km/s] - must be a
vector!!
% Omega_park = 1; %[rad]
% i_park = 1; %[rad]
```

```
% omega_park = 1; %[rad]
%
% [theta, Dv] = functionshw2.hyperbola(mu_park, a_park, e_park, Omega_park, i_park,
omega_park, vh_park);
```

c) meshgrid

```
from Horizons Database

2312-Jan-01 (wrt to solar system barycenter)
